Subject: Centos - OpenVZ Kernel doesn't boot (raid problem)

I installed centos 5, with a driver disk for my highpoint raid card. When I install the openvz kernel (using yum), the kernel doesn't boot.

It shows a kernel panic error, and says that no disks are found...What can I do to get it to work? Is there a way for the ovzkernel to use the drivers that the current kernel is using?

Or what should I do to compile it from source with the same drivers of the current setup kernel?

Or any other solution...

Thanks in advance
