Hi,

I've recently started experimenting OpenVZ and ran into this issue.

On a Debian etch host, running an etch guest when I do a reboot inside a VPS, I can no longer destroy it (or remove the folder).

On a server that has just rebooted, and that has been recently installed with a kernel from download.openvz.org.

/var/lib/vz is a symlink to /vz and /vz is an ext3 partition.

```
server1:~# uptime

```
server1:~# vzlist -a

I then manually ran both scripts inside /etc/cron.d

/usr/share/vzctl/scripts/vpsnetclean then /usr/share/vzctl/scripts/vpsreboot so that the VPS comes back faster.

```
server1:~# /usr/share/vzctl/scripts/vpsnetclean

A vzctl restart xxx will also do the same.

ls of on the private area did not return anything.

Has anyone experienced the same behavior?

Best Regards,

solved Neto
