You don't need rename it in VPS config or in /etc/sysconfig/vz - OpenVZ still uses old naming for compatibility. New name is due to {ip,ip6,arp}\_unification, which is going on in mainstream kernel. So, you need to have - loaded xt\_state module (it is new kernel option - CONFIG\_NETFILTER\_XT\_MATCH\_STATE) before VPS start, "ipt\_state" word in IPTABLES definition in global or VPS config file.
