RobinVossen wrote on Wed, 07 November 2007 09:24Ok, so now I have OpenVZ vs KVM.

From what I read, KVM looks more like xen. Needs virtualization-enabled processors, more overhead, but can run many OSs. OpenVZ has very low overhead, but can only run linux (only some distros).

You told me that KVM had a Changeable size of HD?

I don't know KVM at all. Are you talking about the host or the VM?

In openvz, you can resize the size of the HD of a VM with one command, while the VM is running.

And OpenVZ is made to run 1 OS Virtual with different PCs in it? (Container)[/quote]

I don't understand this question.
