Hello to all

I would like to build a template with the anaconda for two reasons: the template must be a system whith extremely fidelity (Sorry, but I don't know if this is the correct term) to a host usually installed with the CD and 2) I want use a tool that is still being maintained.

The distro I need is the scientfic linux 4.5 precisely. I imagine that this research has already been made for the construction of fedora's templates.

Thank now any help.
