Generally, you either go yum way or manual way -- can not mix both together as rpm/yum doesn't know about the software which you installed without rpm/yum.

Still, there are two options in your particular case:

1. Create and install some stub package which "Provides: ovzkernel". If you have some rpm experience this is pretty trivial.
  2. Download vzctl/vzquota rpms manually and install with rpm -ihv --nodeps command.
