mephisto, can you describe more precisely how unstable it is? Ooopses? Crashes? Lockups? Please, attach some then. It is also helpful to get outputs of Alt-SysRq-p, Alt-SysRq-t, Alt-SysRq-m.

If it is a memory leak or something, need /proc/slabinfo and /proc/meminfo

I also wonder, have you succeeded building initrd in gentoo for i2o_block driver or not? I suppose it is easier to use this driver instead of deprecated one.
