Hrmmm, I don't think that's what I want to do but I'm not entirely sure.

Both 209.160.40.18 and 209.160.28.232 are already on the same VLAN configured on the switch port that the HW Node is physically connected to. The HW node can use either or both of them successfully. I guess you could treat them as being in the same subnet although that's not technically true. I want to assign 209.160.28.232 to the VE but when I do I cannot ping it from the outside and I cannot ping out. I can however ping the HW Node's IP address.
