Hello again,

I was reading the user manual for OpenVZ and I read that the Alloc Memory is a Virtual memory, so theoretically it shouldn't have a limitation right?

Let me rephrase that... I meant that the total shouldn't have a limit, right? I noticed that the privvmpages limits this Alloc limit... Currently my vzmemcheck shows the following:

```
[root@t248 ~]# vzmemcheck -Av
```

Output values in Mbytes

veid	LowMem util	LowMem commit	LowMem util	RAM util	MemSwap commit	MemSwap util	MemSwap commit	Alloc limit	Alloc	Alloc

The question is, is the 1001.00 the maximum that should be used? I mean, take a look at the vzmemcheck -Av, it shows that the sum is actually 1678,21, but it shows underneath that number, 1001,00. But the RAM is still unused... It's only using 114,36 MB of RAM, so I can make privvmpages larger, without problems, even though it sums over the 1001,00, right?

Regards, and again thanks for all your help;)
