Hi, there is no answer to your question. Openvz "VPS"s are not individual operating systems in the conventional sense. Openvz creates process containers which from the inside appear to be an operating system.

The quantity of VEs/containers/VPS' is limited only by the system memory and application placed on the software.

\_Very\_ generally speaking, you can count on 5-10 VPS per CPU I would say. (if they are doing no work, this could be 5000-10000 per cpu. if they are doing a lot of work, this could be .0005 - .0010 per cpu).

hope this makes sense!

Rick
