Hi all,

I just observed a strange problem with nfs, seems that remount does not
work anymore:

My fstab looks like:

aipaddr:/pve/0.9 /pve/0.9 nfs ro 0 0

When I trie to remount that directory rw:

> mount -o remount,rw /pve/0.9/

Everythink works as expected. But remounting it ro later fails:

> mount -o remount,ro /pve/0.9/
mount: /pve/0.9 not mounted already, or bad option

This failure seems to be specific to openvz kernel (2.6.24) from git.
