On a working openvz (test) server (when trying to install postgresql on xampp on HN /opt), I got a kernel panic which reads:

/sbin/init: relocation on /lib/tls/i686/libc.so.6
_dl_out_of_memory
version GLIBC_PRIVATE- not detected ld-linux.so.2 with ....
Kernel Panic- not sycing

The machine is not running in single mode too! Any hint how to mend it?

Thanks!
