Cool, thanks for that. It works - kinda.

The privvmpages count persists across restarts of the VE. Does this mean it's a cumulative count of *all* memory allocations, ever, for that VE? That seems wrong, unless this parameter is not meant be used except in unusual circumstances.

I edited the conf file, and she would start. But subsequent dd commands show that the privvmpages count is still going up, and, sure enough, I ran out of resources again.

The failcnt column is a good idea.

Thanks for your help.

Tony
