Hello, I've recently read this message on the wiki:
http://wiki.openvz.org/Traffic_shaping_with_tc

But I've haven't undestood it totally.
My VPS Servers both work on CentOS and RedHat Enterprise servers, I think it would be great to limit each vps to 512kbps or 1024kbps outbound and inbound.

Is there any basic script to limit per each vps on the server at 512k and not all the venet at once?
