hello

this is my /var/log/boot.log file:

```
Apr 18 09:55:17 localhost syslog: syslogd startup succeeded
Apr 18 09:55:17 localhost syslog: klogd succeeded
Apr 18 09:55:17 localhost sshd: succeeded
Apr 18 09:55:17 localhost xinetd: xinetd startup succeeded
Apr 18 09:55:15 localhost date: Fri Apr 18 09:55:15 CEST 2008
Apr 18 09:55:15 localhost rc.sysinit: Setting clock : Fri Apr 18 09:55:15 CEST 2008 succeeded
Apr 18 09:55:16 localhost rc.sysinit: -e
Apr 18 09:55:16 localhost sysctl: net.ipv4.ip_forward = 0
Apr 18 09:55:16 localhost sysctl: net.ipv4.conf.default.rp_filter = 1
Apr 18 09:55:16 localhost sysctl: net.ipv4.conf.default.accept_source_route = 0
Apr 18 09:55:16 localhost sysctl: error: unknown error 1 setting key 'kernel.sysrq'
Apr 18 09:55:16 localhost sysctl: error: unknown error 1 setting key 'kernel.core_uses_pid'
Apr 18 09:55:16 localhost rc.sysinit: Configuring kernel parameters: failed
Apr 18 09:55:16 localhost rc.sysinit: Setting hostname localhost.localdomain: succeeded
Apr 18 09:55:16 localhost mount: mount: none already mounted or /dev/pts busy
Apr 18 09:55:16 localhost mount: mount: according to mtab, devpts is already mounted on
/dev/pts
Apr 18 09:55:16 localhost rc.sysinit: Mounting local filesystems: failed
Apr 18 09:55:16 localhost rc.sysinit: Enabling swap space: succeeded
Apr 18 09:55:16 localhost iptables: succeeded
Apr 18 09:55:16 localhost iptables: succeeded
Apr 18 09:55:16 localhost sysctl: net.ipv4.ip_forward = 0
Apr 18 09:55:16 localhost sysctl: net.ipv4.conf.default.rp_filter = 1
Apr 18 09:55:16 localhost sysctl: net.ipv4.conf.default.accept_source_route = 0
Apr 18 09:55:16 localhost sysctl: error: unknown error 1 setting key 'kernel.sysrq'
Apr 18 09:55:16 localhost sysctl: error: unknown error 1 setting key 'kernel.core_uses_pid'
Apr 18 09:55:16 localhost network: Setting network parameters: failed
Apr 18 09:55:16 localhost network: Bringing up loopback interface: succeeded
Apr 18 09:55:17 localhost ifup: SIOCADDRT: Network is unreachable
Apr 18 09:55:17 localhost network: Bringing up interface venet0: succeeded
```

What are these errors???

Are these errors maybe connected to my other problem.

This other problem is:

I "vzyumed" Samba onto my VM (Centos-4-minimal). I configured it, but I can't get the SID for my PDC (command: 'net getlocalsid'). When I use this command I get:

```
[2008/04/18 10:13:18, 0] lib/smbldap.c:smbldap_connect_system(982)
```

```
failed to bind to server ldap://localhost.localdomain with dn="cn=Directory Manager" Error: Can't
contact LDAP server
```

(unknown)

SID for domain LOCALHOST is: S-1-5-21-2783649443-751297657-3630824700

Do you need the smb.conf file also, to see what could be wrong?

I can ping this VM without problems.
