Subject: Openvz and emc SAN

We've successfully installed openvz on centos 4.6 and it works great. We're now trying to attach the hp fiber card to a EMC SAN system. We are having problems installing the fiber card driver. When I execute the install script I get:

Emulex LPFC Driver Installer Version 3032
Determining distribution type and kernel version ...
Checking for Emulex LPFCDFC driver packages ...
Checking for old Emulex driver ...
Looking for kernel development package ...
Looking for compilers ...

RPM cannot be installed: ovzkernel-smp-devel-2.6.9-023stab046.2 package is required.

Is there a devel kernel package available?
Thanks for you help
steven
