Hello amatilla,

java1.5 works fine. but it consumes lot's of resources, so we saw out of memory problems with default UBC settings. this included: numproc, privvmpages and kmemsize.

SIGSEGV can happen since java handles it's VM by hands, so it's probably it's bug when Out-Of-memory happens...

to fix the problems, thirst check that /proc/user\_beancounters contains non-zero failcounters (i.e. there were resource shortages when java died). Next, use `vzctl set VPSID` to increase those parameter limits to allow VPS consume more of it.
