Subject: allowing traffic through to Container and still using iptables on hostnode

I am trying to configure iptables on the hostnode to allow traffic through to a container with a public ip address. Basically I want to keep iptables running on the hostnode and i want all internet traffic to go through to the Container, where i will configure the firewall for the container. I have tried looking at the using iptables as a firewall wiki page but it is not really want i want and I am not sure on how to amend it for my needs.

Is it just a case of adding a rule to allow all traffic on the venet interface?

Thanks in advance
