Subject: running with no limits?

Hi there,

I have a server running OpenVZ with several VMs running on it.

At the moment I have to specify various limits to each VM configuration and, when they hit their limits strange things can happen.

Ideally I'd let them all have full access to all the resources available on the physical server. They can fight it out among themselves if they want to compete for the resources. Most of these VMs are quiescent and not actually doing much at all most of the time anyway.

I've not been able to figure out how to configure OpenVZ like this though. Is it something I have to set in each VM config file? Or is it a server-wide thing?

Any ideas?

Thanks!
