Hi all,

I'm a master student and I have been testing live-migration on Openvz and Xen... The tests shows, differently of Xen live-migration, the Openvz live-migration is some slow for my aplication. I think the solution of this problem is implement pre-copy on Openvz live-migration.
Then, I'd like to know,
 why pre-coppy is not implemented on openvz ?

The answer of this question is very important to me.
Thanks all.
