Subject: WVZ, some additional install information

I'm trying to get WVZ running.

This actually should not be a huge problem because it's PHP based, but if you ask me, it's not developed to use /vz

The config file is like this:

```
//Comment this for error reporting/debugging
//error_reporting(0);

//Root user for logging in
$rootuser = "root";

//Root password for logging in
$rootpass = "toor";

//Full path to setuid binary
//The directory where it resides should only be readable by the webserver user
$v = "/wvz/suwvz";

//Enable/disable SSH Java applet in menu (set this to true/false)
//To use is, you must have SSH version 1 enabled on the server
//along with "PasswordAuthentication yes" in sshd_config
$javassh = true;

//port for Java SSH applet
$javassh_port = 22;
```

Where the install docs don't make things very clear also:

http://homaly.dunanet.hu/wvz/install.html

Because the templates are most of the time placed in:

/vz/template/cache

I think it's nicer to have stuff setup like that.

Someone some experience info about this ?

Thanks !
