http://opensolaris.org/os/community/brandz/ I would like to see if something equal to this is on the roadmap in particular. Being able to run solaris and aix closed source binaries contained would be useful.

Other useful feature is some way to share a single process between PID containers as like a container bridge. For containers used for desktop applications not having a single X11 server interfacing with video card is a issue.

These container bridges avoid having to go threw network cards and other means to share data between containers. A user space solution.

I know this reduces secuirty but when you need a application form X distrobuton and you have Y distribution and its opengl heavy you are kinda stuffed at moment.

Final one is some form of LSM processing different. Lot of the Linux Secuirty channel talk about containers as light weight virtualisation so will never need to run a OS inside with a different LSM profile to the master OS. If containers plan to go after brandz like containers this needs to be made clear that LSM different processing will be required.
