kenjy wrote on Mon, 28 July 2008 07:15 Just rsync from the first HN to the second one and do vzctl stop VE in the first HN and then vzctl start VE in the second one.

Hi

There are two problems with that suggestion.

1. I don't need to rsync, as both nodes can see the same filesystem over GFS
2. Stopping and starting the VE defeats the original intent of an online migration.

My problem is that vz migrate will try to rsync the data, which is unnecessary, and potentially damaging to the data.
