Please find the attachment for fedora9 metadata template

Run following command after creating a Node, without this VZ starts spawning getty in loop and node becomes unresponsive. (vz-experts please comment)

rm -f /vz/private/ID/etc/event.d/tty?

I should have added this to postcreate but sorry - my laziness.

If you install fedora on centos-5, vzyum won't work for some reasons (vz-experts please comment). I installed yum inside the node as a work around

Cheers,
