SunFire V20z
CentOS 4
30x VE
uptime since last reboot = 120 days

i first i knew of a problem was customers reporting their VE unavailable

the host node server was unavailable by ssh

i power cycled the server and it returned but the kernel was not the OpenVZ kernel

i edited grub for only one option the OpenVZ kernel and rebooted the system

the kernel failed to load and the server was unavailable

...

it appears that the OpenVZ kernel has failed in operation and broken so that it cannot load

i have 3 other similar machines all running OpenVZ for 1 year already but i have no experience of how to recover from here

help!
