---

(Additional infos)

Initially, I created more than 4 partitions on the physical disk (no LVM).

```
/dev/sda1 /boot  
/dev/sda2 swap  
/dev/sda3 /  
(extended partition -> 4)  
/dev/sda5 /var  
/dev/sda6 /home
```

A 'df -h' doesn't show /boot, but the system was able to boot. Could it be that the kernel 'sees' only the last four partitions ?
