Hi kenjy,

Thanks for your advice. It works for me.

```
$ egrep hosts /etc/nsswitch.conf  
hosts: files mdns4_minimal [NOTFOUND=return] dns mdns4
```

If there are >20 VE (guests) running the list will be a long one.

I heard winbind can solve the problem as well but never trying it. It needs only a simple setup dislike setting up bind9.

Have you had any idea on the max number of VEs (guests) can run concurrently vs CPU + RAM?
Of course all of them are headless server w/o graphic not requiring huge data storage.

B.R.
