Subject: Bind Mount + User Quotas: Is it possible?

I followed the OpenVZ bind mount guide and it worked great! However, I cannot seem to get second level (user/group) quotas working for the files located within the bind mount.

The CT's second level quotas are working, but it is clear that they only account for files truly within the CT. Files located in /home (within the bind mount) do not contribute to the quotas at all.

Configuration:
The CT is located in /home/vz/private/###.
The /home bind mount points to /data/vz/###/home.
/home and /data are two different partitions mounted on the HN like this:
/dev/xxx /data xfs rw,relatime,usrquota,grpquota 0 0
/dev/xxx /home xfs rw,relatime,usrquota,grpquota 0 0
Am I doing something wrong?
