Yeah that sounds cool, but why the f%\$!k I need to add eth0??

And it still doesn't work.

I added eth1 to VE like you said, I got eth1 inside VE. I configured the VLAN 980, set the ip and still nothing:

```
eth1    Link encap:Ethernet  HWaddr 00:18:51:44:65:A8
        inet6 addr: fe80::218:51ff:fe44:65a8/64 Scope:Link
        UP BROADCAST RUNNING MULTICAST  MTU:1500  Metric:1
        RX packets:0 errors:0 dropped:0 overruns:0 frame:0
        TX packets:24 errors:0 dropped:0 overruns:0 carrier:0
        collisions:0 txqueuelen:0
        RX bytes:0 (0.0 b)  TX bytes:1176 (1.1 Kb)
```

```
eth1.980 Link encap:Ethernet  HWaddr 00:18:51:44:65:A8
        inet addr:10.0.0.3  Bcast:10.0.0.255  Mask:255.255.255.0
        inet6 addr: fe80::218:51ff:fe44:65a8/64 Scope:Link
        UP BROADCAST RUNNING MULTICAST  MTU:1500  Metric:1
        RX packets:0 errors:0 dropped:0 overruns:0 frame:0
        TX packets:18 errors:0 dropped:0 overruns:0 carrier:0
        collisions:0 txqueuelen:0
        RX bytes:0 (0.0 b)  TX bytes:1044 (1.0 Kb)
```

```
ping 10.0.0.1
```

```
PING 10.0.0.1 (10.0.0.1) 56(84) bytes of data.
```

```
From 10.0.0.3 icmp_seq=2 Destination Host Unreachable
```

I just think this is impossible, after spending a whole day on this I get use to that this is just fake that OpenVZ ever supported VLANs? please admit that this is not true...
