Hi,
I have openvz running on my centos server
And i got a CT with debian running
On my debian CT i want to have User-Quota for that CT (So i can limit users in that VPS)
And i've tryed to install it the normal way
(apt-get install quota quotatool) But i cannot mount and i don't know what to put in the /etc/fstab as i noticed that i might have to do it through the main node.

vps101:~# mount -o remount /
mount: permission denied

Does anyone know what i have to put or do to get this working?

Thank you so much
Bhavic!
