Hi,
I wanted to migrate an openSUSE 11 from a physical server into a VE.
I did read some articles about "Physical to container" and "OpenSUSE template creation".
Then I copied everything from the physical server into /vz/private/XXXX, created a /etc/vz/conf/XXXX.conf with parameter IP_ADDRESS in it (here XXXX is my VEID).
And I disabled the VE's udev, created several necessary devices in /dev using mknod, modified /etc/fstab, linked /proc/mounts to /etc/mtab ... and so on.

By far, every is fine except network doen't work. I can't ping from or into the VE.

When I do a "ifconfig" inside the VE, nothing retrieved.
While when I do a "ifconfig -a", the result shows as below.

```
------------------------------
# ifconfig -a
lo        Link encap:Local Loopback
          LOOPBACK  MTU:16436  Metric:1
          RX packets:0 errors:0 dropped:0 overruns:0 frame:0
          TX packets:0 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0 txqueuelen:0
          RX bytes:0 (0.0 b)  TX bytes:0 (0.0 b)

venet0    Link encap:UNSPEC  HWaddr 00-00-00-00-00-00-00-00-00-00-00-00-00-00-00-00
          BROADCAST POINTOPOINT NOARP  MTU:1500  Metric:1
          RX packets:0 errors:0 dropped:0 overruns:0 frame:0
          TX packets:0 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0 txqueuelen:0
          RX bytes:0 (0.0 b)  TX bytes:0 (0.0 b)
------------------------------
```

So, can anyone help me or give a tip please?
Thank you.
