Hello,

anything in dmesg or in logs on the HN or inside VE?

Quote:

If I boot the system with the default fedora 9 kernel it works well and I can login and access the mounted directories as expected.

As far as I understand you've tried to access ve2. How are you able to run any VE with default Fedora kernel?

Quote:

If you look at the output of mount I posted a few lines ago you can see that tcp is used as protocol. I never configured the system to use tcp since all other boxes using the file server uses udp. Does the ovz kernel do any modifications to nfs mount and where to configure the behavior?

Why don't you set appropriate options explicitly?
