Sorry for the English, but I can't read or write in Russian. This thread however was mentioned in Bugzilla. If I understand correctly, the latest Gentoo is also bitten by this bug. The problem is the utimensat patch in 2.6.18 kernels which doesn't work nicely with the cp and touch commands in coreutils 6.12.

At this point you have three options:

* Apply the patch to the OpenVZ kernel (if I understand correctly it will be included in the next maintance release, but when that will is unknown)
* Use the 2.6.24 kernel (not for production servers)
* Downgrade coreutils to version 6.11 or lower

The Gentoo developers have a patch for coreutils and the OpenVZ 2.6.18 kernel which should work also. However I've not tested that.
