Hi,

I'm posting a thread, because I don't understand the difference between vfs_reads and vfs_read_cahrs in IO Account (/proc/bc/<CT-ID>/ioacct).

And What's the unit of vfs_reads and vfs_read_chars

Exemple for a CT :

```
------------------------------
        read                    0
        write                   0
        dirty                   0
        cancel                  0
        missed                  0
        syncs_total            20
        fsyncs_total         32641961
        fdatasyncs_total           440
        range_syncs_total            0
        syncs_active                 0
        fsyncs_active                0
        fdatasyncs_active            0
        range_syncs_active           0
        vfs_reads            186971793
        vfs_read_chars   1833248264832521650
        vfs_writes           1937841860
        vfs_write_chars   2795685237397960
        io_pbs                       0
------------------------------
```

Thank you in Advance.

Regards,
