Hello,

Quote:

I want a number of veth's available for my CT101 (e.g. veth101.0 and veth101.1), only using eth0.

It's not a correct desire.

Look, vzctl allows you to create eth0 interface inside VE.

vzctl --netif\_add creates eth0 inside VE and gives a possibility to reach it from the HN through veth101.0. Then if you create eth1 interface inside VE veth101.1 interface should be created on the HN etc. That's why your desire looks a little bit strange. Could you please explain what are you going to do?
