Subject: VPS Question

Now that I have A GUI for management I have several other questions.

The templates are not really the full OS, how do I get the full OS installed, and is there a way to RDP into them once the OS has been installed in case you would prefer not doing everything from the command line.

I am currently running Centos 5 on my HWN, I have centos, fedora, and ubuntu templates installed. One VPS created that is running centos 5 template.

Thanks Again,
