Hello,

Quote:

Now I sometimes get the error:

/proc/user_beancounters is the file you should look at.

Increasing counters in failcnt column (the last column) point you to resource you have to increase.

Is there a way to switch off all limits for all containers so that they behave the same as with VServer?

I don't know how to achieve this in general situation but you can always adjust per VE configuration file with a quite big values.

You can also create the single config-sample file and then create VEs which will be based on that single file (vzctl create \$VEID --config)
