Thank you, maratrus. But, it seems to me that something isn't right if you get the same config for a container supposedly having 1/2 the resources of the hardware node and for one with 1/5 the resources. I ended up by starting with the config generated by "vzsplit -n 6" and multiplying most parameters by 2 and 3, respectively, to get containers with 1/3 and 1/2 the resources of the hardware. I did that for all parameters except NUMIPTENT, DISKSPACE, DISKINODES, and CPUUNITS. Hopefully, I'm not doing anything terribly wrong.
