Ok, that clarifies the difference between CPU and CPULIMIT.

But at this point i dont know which of the two should I use...

I have 2 quad core Xeon Processors for a total of 8 CPUs, and i want to run at least 200 VEs :

If i set CPUS="1" for each VE, i'm affraid the server will saturate.
CPULIMIT seems to be the better solution for me, but i'm affraid to lose performances.
And finally i dont know if leave the VEs without limits its a good idea.

confusing...
