Hello,

the main problem I suppose is that none of the MY_PC's interfaces know about VLAN existence. To make a route decision on MY_PC's side we have to pick out a VLAN tag of a network packet but it's impossible because MY_PC knows nothing about VLAN existence so the network packet is dropped.

I would recommend to read the following article which might be useful in your case.
http://en.gentoo-wiki.com/wiki/OpenVZ_VLANs
