Subject: Mounting specific /etc on VEs

Hi,

I thought it would be great to mount all /etc of my VEs with a special filesystem: "wayback" with fuse. This keeps track of all changes in the directory tree.

Is this a good idea? Reliable?

And: What do I need to change to get it working? In a physical system I would create an entry in /etc/fstab and the filesystem would be mounted very, very early in boot stange. I guess this would work. But with VEs in OpenVZ?

Regards,
divB
