Subject: Stale mtab entries following stop

I have a couple of containers, which use the mount/unmount action scripts to mount physical partitions into the root file system, e.g.

mkdir -p /var/lib/vz/root/1005/srv/mail
mount -t xfs /dev/r5/mail /var/lib/vz/root/1005/srv/mail
umount /var/lib/vz/root/1005/srv/mail

However, following a vzctl stop the device is unmounted, but it is still listed in /etc/mtab. And each time I cycle the container, another instance pops up.

If I unmount the device manually with the VE stopped, umount moans that the device is not mounted, but all entries are removed at once.

Any idea, what might cause this?
