First of all in OpenVZ only one kernel works! Each VE (VPS) doesn't have separate kernel. So you have to compile module using 2.6.16-026test0XX kernel sources.

Secondary, if you've even managed to compile DRBD module inside VPS, you can't load module inside VPS, you can do it only in VE0 (on Hardware Node). After that you can move drbd device inside VPS using vzctl.

HTH,  
Goog luck.
