Hi !!

I'm trying to validate my config files, and I get several errors like:

Error: limit should be = 9223372036854775807 for vmguarpages (currently, 2147483647)
Error: limit should be = 9223372036854775807 for oomguarpages (currently, 2147483647)
Error: limit should be = 9223372036854775807 for physpages (currently, 2147483647)

First, i want to know if the command vzcfgvalidate is reliable or not.

Secondly I want to know why it suggest to me to sett these parameters to 9223372036854775807, the maximum limit of a 64-bit system. This is safe in a system that is running more than 100 VE ?

(Im running Debian Lenny x64)

Thanks !
