hi

[root@localhost 101]# uname -r
2.6.18-164.10.1.el5.028stab067.4
[root@localhost 101]# uname -v
#1 SMP Thu Jan 14 21:23:12 MSK 2010

well i located the problem.

what i need to do is to make from VPS Quagga router.
But the thing is that I need to use tar.gz format so I can compile quagga enabling SNMP on it.

When i enter VPS with command #vzctl enter CTID
and untar the file after it I can not compile it cuz i need gcc.

And to get gcc I am trying to provide Internet connection into the VPS but its not working.
I tried
http://wiki.openvz.org/Getting_started_with_OpenVZ_live_CD#S etting_up_VE_networking

but I dont manage to do that.

When I tried just to download gcc pakcket and install inside the VCT it says that it needs cpp..when i tried cpp it was incompatible..

Dont know what to do!

Thanks!
