Subject: Symlink vmbr0 to eth0?

I have linux distro that is built on the premise that there is an eth0 being watched/used for monitoring. I have a few 3rd party update scripts also calling for eth0. I get chocked up seeing everything in red and saying offline in the default 'status' command when if only I had an eth0, it would say everything is responding.

Is there anyway to link vmbr0 for example to eth0 on CentOS?

Distro: PBX in a Flash based off CentOS 4.3
