Subject: compiling RHEL5 under Debian Lenny

Hi,

is there a manuel how to compile the RHEL5 Source with Debian? We're using the old 2.6.18 Kernel, but have to upgrade for security reasons.

We were told to use the 2.6.32 kernel, but openvz is not available in a stable version for this kernel.

I've tried to compile the source of the Debian 2.6.26 Kernel, but can't patch it with the openvz patch from debian.

So, the last chance is the RHEL5 Kernel, but I can't compile it.
I've got errors with rpm which says that some programs like perl, gzip etc are not installed but they are.

Any help?

Cheers, Ingo
