Hi,

I'm sorry, I'm no expert in this area but I'll try to explain my problem more precisely. In the link I gave, this <http://bugs.debian.org/cgi-bin/bugreport.cgi?bug=390404#42> message is the one I'm referring to.

Meaning that the VE seems to try to mount NFS share using the venet0-device which has ip 127.0.0.1 and not venet0:0 which can access the NFS share. The fix suggested was to change the order of the devices in what I think is /etc/network/interfaces but the file states that you shouldn't change it manually since it's made by OpenVZ?

If there's another solution or someplace else I should ask that's ok also.
