Subject: Ubuntu 10.04 container hangs after vzrestore

Hello.

Apologizes in advance of the answer to this is obvious, I've searched Google, the Wiki, and this forum and haven't found anything that works.

I've done a vzrestore of an Ubuntu 10.04 container on the same HN from which it originated. I destroyed the prior container and restored to the same CTID.

Starting the container works fine, however, the process count when doing 'vzlist' is 1, and the process itself is the init task. I've checked /proc/user_beancounters to see if there were any resource problems, and the failcnt is 0 on everything concerning this CT.

Any thoughts on how I can troubleshoot this further, it seems init is indeed where things are hanging, but I'm not sure as to why.
