Here it is necessary to collect the server under VPS. It is clear that each user VPS will "force"

I.e. there will be many simultaneous calls to a disk, practically on everyone VPS <L etc.
There are some variants how to organize a disk subsystem.
Help to be defined please with an optimal ratio the price - speed

1 variant soft raid10 from 4 sata disks of type WD RE3 or RE4
2 soft raid1 from 2 sata WD VelociRaptor

3 and 4 too most only with normal raid the controler

Generally, what pluses to expect from normal spot-check. When we use raid5 there pluses are

data here theoretically shouldn't be

such. At them after all at each vendor the format...
